

Parkinson's Disease: Motor and Non-Motor Manifestations over Time

Movement Disorders Society

BACKGROUND: Parkinson's disease (PD) is the second most common neurodegenerative disorder, primarily affecting dopaminergic neurons in the substantia nigra pars compacta.

CLINICAL MANIFESTATIONS: The core motor symptoms include resting tremor, bradykinesia, rigidity, and postural instability. Non-motor symptoms, often preceding motor onset, include REM sleep behavior disorder, anosmia, constipation, and depression.

DISEASE PROGRESSION: As the disease advances, patients may develop motor fluctuations (wearing-off phenomenon) and levodopa-induced dyskinesias, complicating long-term management.
