

Osimertinib in Untreated EGFR-Mutated Advanced Non-Small-Cell Lung Cancer

Soria JC, Ohe Y, Vansteenkiste J, et al.

BACKGROUND: Osimertinib is an oral, third-generation, epidermal growth factor receptor (EGFR) tyrosine kinase inhibitor...

RESULTS: The median progression-free survival was significantly longer with osimertinib than with standard EGFR-TKIs (18.9 months vs. 10.2 months; hazard ratio for disease progression or death, 0.46; $P < 0.001$).

CONCLUSION: Osimertinib showed efficacy superior to that of standard EGFR-TKIs in the first-line treatment of EGFR-mutated advanced NSCLC, with a similar safety profile.

CLINICAL IMPACT: Establishes Osimertinib (Tagrisso) as the global standard of care for 1st line EGFR+ NSCLC patients (e.g. Patient P001).
