

Angiotensin-Neprilysin Inhibition versus Enalapril in Heart Failure

McMurray JJ, Packer M, Desai AS, et al.

BACKGROUND: We compared the angiotensin receptor-neprilysin inhibitor LCZ696 (sacubitril-valsartan) with enalapril in patients who had heart failure with a reduced ejection fraction...

RESULTS: The trial was stopped early, after a median follow-up of 27 months, because the boundary for an overwhelming benefit with LCZ696 had been crossed. LCZ696 reduced the risk of death from cardiovascular causes or hospitalization for heart failure by 20% compared to enalapril.

CONCLUSION: LCZ696 was superior to enalapril in reducing the risks of death and of hospitalization for heart failure.

CLINICAL IMPACT: Entresto becomes the new foundational therapy for chronic heart failure patients (e.g. Patient P014, P019).
